Grades 6-8 SCIENCE

Introduction

In 2014 Missouri legislators passed House Bill 1490, mandating the development of the Missouri Learning Expectations. In April of 2016, these Missouri Learning Expectations were adopted by the State Board of Education. Groups of Missouri educators from across the state collaborated to create the documents necessary to support the implementation of these expectations.

One of the documents developed is the item specification document, which includes all Missouri grade level/course expectations arranged by domains/strands. It defines what could be measured on a variety of assessments. The document serves as the foundation of the assessment development process.

Although teachers may use this document to provide clarity to the expectations, these specifications are intended for summative, benchmark, and large-scale assessment purposes.

Components of the item specifications include:

Expectation Unwrapped breaks down a list of clearly delineated content and skills the students are expected to know and be able to do upon mastery of the Expectation.

Depth of Knowledge (DOK) Ceiling indicates the highest level of cognitive complexity that would typically be assessed on a large scale assessment. The DOK ceiling is not intended to limit the complexity one might reach in classroom instruction.

Item Format indicates the types of test questions used in large scale assessment. For each expectation, the item format specifies the type best suited for that particular expectation.

Content Limits/Assessment Boundaries are parameters that item writers should consider when developing a large scale assessment. For example, some expectations should not be assessed on a large scale assessment but are better suited for local assessment.

Sample stems are examples that address the specific elements of each expectation and address varying DOK levels. The sample stems provided in this document are in no way intended to limit the depth and breadth of possible item stems. The expectation should be assessed in a variety of ways.

Possible Evidence indicates observable methods in which a student can show understanding of the expectations.

Stimulus Materials defines types of stimulus materials that can be used in the item stems.

Grades 6-8 SCIENCE

Earth and Space Sciences		6-8.ESS1.A.1
Core Idea Component MLS	Earth's Place in the Universe The Universe and its Stars Develop and use a model of the Earth-sun-moon system to explain the cyclic patterns of lunar phases and eclipses of the sun and moon.	
	Expectation Unwrapped [Clarification Statement: Examples of models can be physical, graphical, or conceptual and should emphasize relative positions and distances.] SCIENCE AND ENGINEERING PRACTICES Developing and Using Models <ul style="list-style-type: none">Develop and use a model to explain the cyclic patterns of lunar phases and eclipses of the sun and moon. DISCIPLINARY CORE IDEAS The Universe and Its Stars <ul style="list-style-type: none">Patterns of the apparent motion of the Sun, moon, and stars in the sky can be observed, described, predicted, and explained with models. Earth and the Solar System <ul style="list-style-type: none">This model of the solar system can explain eclipses of the sun and the moon. Earth's axis is fixed in direction over the short-term but tilted relative to its orbit around the sun. The seasons are a result of that tilt and are caused by the differential intensity of sunlight on different areas of Earth throughout the year. CROSSCUTTING CONCEPTS Patterns <ul style="list-style-type: none">Use patterns to identify cause and effect relationships between the relative positions of Earth, the moon, and the Sun and the cyclic patterns of lunar phases and eclipses of the sun and moon. <u>Content Limits/Assessment Boundaries</u>	<u>Sample Stems</u>																
<ul style="list-style-type: none"> Tasks should not include: <ul style="list-style-type: none"> Memorization of moon phases or eclipses as in fill in diagrams <p style="text-align: center;">Possible Evidence</p> <p>Observable features of the student performance by the end of the course:</p> <ul style="list-style-type: none"> Components of the model <ul style="list-style-type: none"> To make sense of a given phenomenon involving, students develop a model (e.g., physical, conceptual, graphical) of the Earth-moon-sun system in which they identify the relevant components, including: <ul style="list-style-type: none"> Earth, including the tilt of its axis of rotation. Sun. Moon. Solar energy. Students indicate the accuracy of size and distance (scale) relationships within the model, including any scale limitations within the model. Relationships <ul style="list-style-type: none"> In their model, students describe* the relationships between components, including: <ul style="list-style-type: none"> Earth rotates on its tilted axis once an Earth day. The moon rotates on its axis approximately once a month. Relationships between Earth and the moon: <ul style="list-style-type: none"> The moon orbits Earth approximately once a month. The moon rotates on its axis at the same rate at which it orbits Earth so that the side of the moon that faces Earth remains the same as it orbits. The moon's orbital plane is tilted with respect to the plane of the Earth's orbit around the sun. Relationships between the Earth-moon system and the sun: <ul style="list-style-type: none"> Earth-moon system orbits the sun once an Earth year. Solar energy travels in a straight line from the sun to Earth and the moon so that the side of Earth or the moon that faces the sun is illuminated. Solar energy reflects off of the side of the moon that faces the sun and can travel to Earth. The distance between Earth and the sun stays relatively constant throughout the Earth's orbit. 	<p>A student noticed that the Moon's appearance seemed to change from night to night. They decided to check the library for more information about the Moon's appearance. The student discovered the following information: Figure 1 shows a model of the Sun, Earth and Moon. Figure 2 shows some of the different appearances of the Moon and the name of each of these phases.</p> <p style="text-align: center;">Figure 1. Movement of Earth and the Moon</p> <p style="text-align: center;">Figure 2. Phases of the Moon</p> <table border="1"> <tbody> <tr> <td>New moon</td> <td>Waxing crescent</td> <td>First quarter</td> <td>Waxing gibbous</td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td>Full moon</td> <td>Waning gibbous</td> <td>Third quarter</td> <td>Waning crescent</td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> </tr> </tbody> </table>	New moon	Waxing crescent	First quarter	Waxing gibbous					Full moon	Waning gibbous	Third quarter	Waning crescent				
New moon	Waxing crescent	First quarter	Waxing gibbous														
Full moon	Waning gibbous	Third quarter	Waning crescent														

Grades 6-8 SCIENCE

- Solar energy travels in a straight line from the sun and hits different parts of the curved Earth at different angles — more directly at the equator and less directly at the poles.
- The Earth's rotation axis is tilted with respect to its orbital plane around the sun. Earth maintains the same relative orientation in space, with its North Pole pointed toward the North Star throughout its orbit.
- Connections
 - Students use patterns observed from their model to provide causal accounts for events, including:
 - Moon phases:
 - Solar energy coming from the sun bounces off of the moon and is viewed on Earth as the bright part of the moon.
 - The visible proportion of the illuminated part of the moon (as viewed from Earth) changes over the course of a month as the location of the moon relative to Earth and the sun changes.
 - The moon appears to become more fully illuminated until "full" and then less fully illuminated until dark, or "new," in a pattern of change that corresponds to what proportion of the illuminated part of the moon is visible from Earth.
- Eclipses:
 - Solar energy is prevented from reaching the Earth during a solar eclipse because the moon is located between the sun and Earth.
 - Solar energy is prevented from reaching the moon (and thus reflecting off of the moon to Earth) during a lunar eclipse because Earth is located between the sun and moon.
 - Because the moon's orbital plane is tilted with respect to the plane of the Earth's orbit around the sun, for a majority of time during an Earth month, the moon is not in a position to block solar energy from reaching Earth, and Earth is not in a position to block solar energy from reaching the moon.
- Students use their model to predict:
 - The phase of the moon when given the relative locations of the Earth, sun, and moon.
 - The relative positions of the Earth, sun, and moon when given a moon phase.
 - Whether an eclipse will occur, given the relative locations of the Earth, sun, and moon and a position on Earth from which the moon or sun can be viewed (depending on the type of eclipse).
 - The relative positions of the Earth, sun, and moon, given a type of eclipse and a position on Earth from which the moon/sun can be viewed.

Stimulus Materials

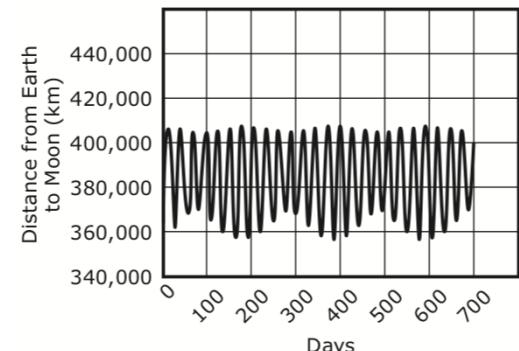

Graphic organizers, diagrams, graphs, data tables, drawings.

The student also discovered Table 1 and Figure 3, which display data of how the distance between the Moon and the Earth changes. Figure 3 was created using data gained through laser-range finding. In this method, lasers on Earth are fired toward reflectors that were left on the Moon by astronauts or probes. The amount of time it takes for each pulse to return to Earth is used to precisely calculate the distance between the Earth and the Moon. Perigee is the point in the Moon's orbit at which it is nearest the Earth. Apogee is the point in the Moon's orbit at which it is farthest from Earth.

Table 1. Distance from Earth to Moon

Position	Distance in kilometers (km)
perigee (point nearest to Earth)	356,565
mean	384,400
apogee (point farthest from the Earth)	406,464

Figure 3.
Distance from Earth to Moon

The student modified Figure 1 to make Figure 4 and found Figure 5, which is a representation of images taken by the Lunar

Reconnaissance Orbiter probe, launched in 2009.

Figure 4.
Illumination of the Earth and Moon

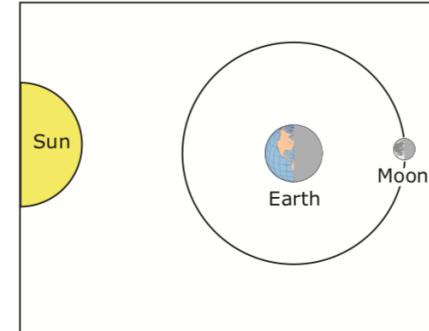

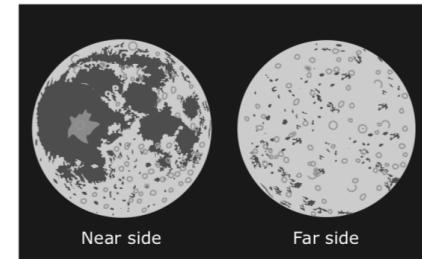

Figure 5.
The Near and Far Sides of the Moon

It takes about 8 minutes and 20 seconds for light from the Sun to reach Earth. Light travels from the Moon to the Earth in about 1.3 seconds. The student found the data in Table 2 about the orbit of the Earth around the Sun. The data from the Sun is based on a technique that involves measuring the movement of the Sun as seen from two locations on Earth that are distant from each other. This method is called triangulation. Compare the data in Table 1 with the data in Table 2 to answer the following questions.

Grades 6-8 SCIENCE

Table 2. Distance Between the Earth and the Sun

Position	Distance ($\times 10^6$ km)
perihelion (point nearest to the Sun)	147.1
mean - average	149.6
aphelion (point farthest from the Sun)	152.1

1. Compare the size of the Earth's orbit around the Sun to the size of the Moon's orbit around the Earth. Support your comparison with data.
2. What does the pattern of data you see allow you to conclude about the orbits of the Earth and Moon?

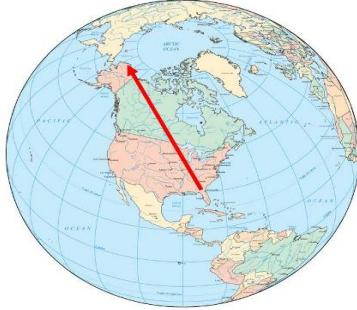

Grades 6-8 SCIENCE

Grades 6-8 SCIENCE

- the gravitational forces from the center of the Milky Way cause stars and stellar systems to orbit around the center of the galaxy.
- the hierarchy pattern of orbiting systems in the solar system was established early in its history as the disk of dust and gas was driven by gravitational forces to form moon-planet and planet-sun orbiting systems.
- Students use the model to describe that objects too far away from the sun do not orbit it because the sun's gravitational force on those objects is too weak to pull them into orbit.
- Students use the model to describe what a given phenomenon might look like without gravity (e.g., smaller planets would move in straight paths through space rather than orbiting a more massive body).

Grades 6-8 SCIENCE

CROSSCUTTING CONCEPTS

Scale, Proportion, and Quantity

- Time, space, and energy phenomena can be observed at various scales using models to study systems that are too large or too small to be directly observed.
- On both large and small spatial scales, gather evidence of geoscience processes to construct an explanation.

Content Limits/Assessment Boundaries

- Tasks should focus on relative time scales.
- Tasks should not require the memorization of facts, observations, or data that can be used as evidence.

Possible Evidence

- Students articulate a statement that relates a given phenomenon to a scientific idea, including that geoscience processes have changed Earth's surface at varying time and spatial scales.
- Students use evidence and reasoning to construct an explanation for the given phenomenon, which involves changes at Earth's surface.
- Students identify and describe the evidence necessary for constructing an explanation, including
 - the slow- and large-scale motion of Earth's plates and the results of those motions.
 - surface weathering, erosion, movement, and the deposition of sediment ranging from large to microscopic scale (e.g., sediment consisting of boulders and microscopic grains of sand, raindrops dissolving microscopic amounts of minerals).
 - rapid catastrophic events.
- Students identify the corresponding time scales for each identified geoscience process.
- Students use multiple valid and reliable sources, which may include students' own investigations, evidence from data, and observations from conceptual models used to represent changes that occur on very large or small spatial and/or temporal scales (e.g., stream tables to illustrate erosion and deposition, maps and models to show the motion of tectonic plates).
- Students use reasoning, along with the assumption that theories and laws that describe the natural world operate today as they did in the past and will continue to do so in the future, to connect the evidence and support an explanation for how geoscience processes have changed Earth's surface at a variety of temporal and spatial scales. Students describe the following chain of reasoning for their explanation:

Image 1

The second image was taken at the same site on August 31, 2005.

Image 2

Grades 6-8 SCIENCE

- The motion of Earth's plates produces changes on a planetary scale over a range of time periods from millions to billions of years. Evidence for the motions of plates can explain large-scale features of Earth's surface (e.g., mountains, distribution of continents) and how they change.
- Surface processes such as erosion, movement, weathering, and deposition of sediment can modify surface features, such as mountains, or create new features, such as canyons. These processes can occur at spatial scales ranging from large to microscopic over time periods ranging from years to hundreds of millions of years.
- Catastrophic changes can modify or create surface features over a very short period of time compared to other geoscience processes, and the results of those catastrophic changes are subject to further changes over time by processes that act on longer time scales (e.g., erosion of a meteor crater).
- A given surface feature is the result of a broad range of geoscience processes occurring at different temporal and spatial scales.
- Surface features will continue to change in the future as geoscience processes continue to occur.

1. Make a claim and support it with a piece of evidence from the photos to explain what happened during the four year time span.

Earth and Space Sciences		6-8.ESS2.B.1
Core Idea	Earth's Systems	
Component	Plate Tectonics and Large-Scale Systems	
MLS	Analyze and interpret data on the distribution of fossils and rocks, continental shapes, and seafloor structures to provide evidence of the past plate motions.	
<u>Expectation Unwrapped</u>		<u>DOK Ceiling</u> 3
<p>[Clarification Statement: Examples of data include similarities of rock and fossil types on different continents, the shapes of the continents (including continental shelves), and the locations of ocean structures (such as ridges, fracture zones, and trenches).]</p> <p>SCIENCE AND ENGINEERING PRACTICES</p> <p>Analyzing and Interpreting Data</p> <ul style="list-style-type: none"> Analyze and interpret data to provide evidence for and explain plate tectonic movement over time and at various scales. <p>Scientific Knowledge is Open to Revision in Light of New Evidence</p> <ul style="list-style-type: none"> Science findings are frequently revised and/or reinterpreted based on new evidence. 		<u>Item Format</u> Selected Response Constructed Response Technology Enhanced
<p>DISCIPLINARY CORE IDEAS</p> <p>The History of Planet Earth</p> <ul style="list-style-type: none"> Tectonic processes continually generate new ocean sea floor at ridges and destroy old sea floor at trenches. <p>Plate Tectonics and Large-Scale System Interactions</p> <ul style="list-style-type: none"> Maps of ancient land and water patterns, based on investigations of rocks and fossils, make clear how Earth's plates have moved great distances, collided, and spread apart. <p>CROSSCUTTING CONCEPTS:</p> <p>Patterns</p> <ul style="list-style-type: none"> Patterns are determined from the analysis and interpretation of data to use as evidence for explanations. The explanation may be revised when new data or interpretation is presented. 		

Grades 6-8 SCIENCE

Content Limits/Assessment Boundaries

- Tasks should avoid paleomagnetic anomalies in oceanic or continental crust.
- Tasks should not require the memorization of names or locations of tectonic plates, names of fossils, or the names and locations of ridges, fracture zones, and trenches.

Possible Evidence

- Students organize given data that represent the distribution and ages of fossils and rocks, continental shapes, seafloor structures, and/or age of oceanic crust.
- Students describe what each dataset represents.
- Students organize the given data in a way that facilitates analysis and interpretation.
- Students analyze the data to identify relationships (including relationships that can be used to infer numerical rates of change, such as patterns of age of seafloor) in the datasets about Earth features.
- Students use the analyzed data to provide evidence for past plate motion. Students describe the following patterns:
 - Regions of different continents that share similar fossils and similar rocks suggest that, in the geologic past, those sections of continents were once attached and have since separated.
 - The shapes of continents, which roughly fit together (like pieces in a jigsaw puzzle) suggest that those land masses were once joined and have since separated.
 - The separation of continents by the sequential formation of new seafloor at the center of the ocean is inferred by age patterns in oceanic crust that increase in age from the center of the ocean to the edges of the ocean.
 - The distribution of seafloor structures (e.g., volcanic ridges at the centers of oceans, trenches at the edges of continents) combined with the patterns of ages of rocks of the seafloor (youngest ages at the ridge, oldest ages at the trenches) supports the interpretation that new crust forms at the ridges and then moves away from the ridges as new crust continues to form and that the oldest crust is being destroyed at seafloor trenches.

Grades 6-8 SCIENCE

Content Limits/Assessment Boundaries

- Tasks should avoid the dynamics of the Coriolis effect.

Possible Evidence

- To make sense of a phenomenon, students develop a model in which they identify the relevant components of the system, with inputs and outputs, including
 - the rotating Earth, the atmosphere, the ocean (including the relative rate of thermal energy transfer of water compared to land or air), the continents and the distribution of landforms on the surface of Earth, global distribution of ice, distribution of living things,
 - energy, including
 - radiation from the sun as an input.
 - thermal energy that exists in the atmosphere, water, land, and ice (as represented by temperature).
- In the model, students identify and describe the relationships between components of the system, including
 - Differences in the distribution of solar energy and temperature changes
 - Higher latitudes receive less solar energy per unit of area than do lower latitudes, resulting in temperature differences based on latitude.
 - Smaller temperature changes tend to occur in oceans than on land in the same amount of time.
 - In general, areas at higher elevations have lower average temperatures than do areas at lower elevations.
 - Features on the Earth's surface, such as the amount of solar energy reflected back into the atmosphere or the absorption of solar energy by living things, affect the amount of solar energy transferred into heat energy.
 - Motion of ocean waters and air masses (matter)
 - Fluid matter (i.e., air and water) flows from areas of higher density to areas of lower density (due to temperature or salinity). The density of a fluid can vary for several different reasons (e.g., changes in salinity and temperature of water can each cause changes in density). Differences in salinity and temperature can, therefore, cause fluids to move vertically and, as a result of vertical movement, also horizontally because of density differences.
 - Factors affecting the motion of wind and currents

Figure 1 -

Figure 2 -

Table 1 - Average High Temperatures

City	June	July	August
Salt Lake City, UT	82	90	88
Naples, Italy	70	77	77

- Describe how conditions of two cities on the same latitude are different and cause the average high temperatures to vary.

Grades 6-8 SCIENCE

- Earth's rotation causes oceanic and atmospheric flows to curve when viewed from the rotating surface of Earth (Coriolis effect).
- The geographical distribution of land limits where ocean currents can flow.
- Landforms affect atmospheric flows (e.g., mountains deflect wind and/or force it to higher elevation).
- Thermal energy transfer
 - Thermal energy moves from areas of high temperature to areas of lower temperature either through the movement of matter, via radiation, or via conduction of heat from warmer objects to cooler objects.
 - Absorbing or releasing thermal energy produces a more rapid change in temperature on land compared to in water.
 - Absorbing or releasing thermal energy produces a more rapid change in temperature in the atmosphere compared to either on land or in water, so the atmosphere is warmed or cooled by being in contact with land or the ocean.
- Students use the model to describe the following:
 - The general latitudinal pattern in climate (higher average annual temperatures near the equator and lower average annual temperatures at higher latitudes) is caused by more direct light (greater energy per unit of area) at the equator (more solar energy) and less direct light at the poles (less solar energy)
 - The general latitudinal pattern of drier and wetter climates is caused by the shift in the amount of air moisture during precipitation from rising moisture-rich air and the sinking of dry air.
 - The pattern of differing climates in continental areas as compared to the oceans occurs because water can absorb more solar energy for every degree change in temperature compared to land, so there is a greater and more rapid temperature change on land than in the ocean. At the centers of landmasses, this leads to conditions typical of continental climate patterns.
 - The pattern that climates near large water bodies, such as marine coasts, have comparatively smaller changes in temperature relative to center of the landmass occurs because land near the oceans can exchange thermal energy through the air, resulting in smaller changes in temperature. At the edges of landmasses, this leads to marine climates.
 - The pattern that climates at higher altitudes have lower temperatures than climates at lower altitudes occurs because of the direct relationship between temperature and pressure. Given the same amount of thermal energy, air at lower pressures (higher altitudes) will have lower temperatures than air at higher pressures (lower altitudes).
 - Regional patterns of climate (e.g., temperature or moisture) are related to a specific patterns of water or air circulations, including the role of the following in contributing to the climate pattern:

Grades 6-8 SCIENCE

<ul style="list-style-type: none">▪ Air or water moving from areas of high temperature, density, and/or salinity to areas of low temperature, density, and/or salinity▪ Earth's rotation, which affects atmospheric and oceanic circulation▪ The transfer of thermal energy with the movement of matter▪ The presence of landforms (e.g., the rain shadow effect) <ul style="list-style-type: none">● Students use the model to describe the role of each of its components in producing a given regional climate

Earth and Space Sciences		6-8.ESS3.B.1
Core Idea	Earth and Human Activity	
Component	Natural Hazards	
MLS	Analyze and interpret data on natural hazards to forecast future catastrophic events and inform the development of technologies to mitigate their effects.	
<u>Expectation Unwrapped</u>		<u>DOK Ceiling</u> 3 <u>Item Format</u> Selected Response Constructed Response Technology Enhanced
<p>[Clarification Statement: Emphasis is on how some natural hazards, such as volcanic eruptions and severe weather, are preceded by phenomena that allow for reliable predictions, but others, such as earthquakes, occur suddenly and with no notice, and thus are not yet predictable. Examples of natural hazards can be taken from interior processes (such as earthquakes and volcanic eruptions), surface processes (such as mass wasting and tsunamis), or severe weather events (such as hurricanes, tornadoes, and floods). Examples of data can include the locations, magnitudes, and frequencies of the natural hazards. Examples of technologies can be global (such as satellite systems to monitor hurricanes or forest fires) or local (such as building basements in tornado-prone regions or reservoirs to mitigate droughts).]</p>		
<p><u>SCIENCE AND ENGINEERING PRACTICES</u></p> <p>Analyzing and Interpreting Data</p> <ul style="list-style-type: none"> Analyze and interpret data on natural hazards to identify and analyze patterns for the purpose of predicting future events and developing technologies to minimize their effects. 		
<p><u>DISCIPLINARY CORE IDEAS</u></p> <p>Natural Hazards</p> <ul style="list-style-type: none"> Mapping the history of natural hazards in a region, combined with an understanding of related geologic forces, can help forecast the locations and likelihoods of future events. 		
<p><u>CROSSCUTTING CONCEPTS</u></p> <p>Patterns</p> <ul style="list-style-type: none"> Graphs, charts, and images can be used to identify patterns in data. <p>Influence of Science, Engineering, and Technology on Society and the Natural World</p> <ul style="list-style-type: none"> The uses of technologies and any limitations on their use are driven by individual or societal needs, desires, and values; by the findings of scientific research; and by differences in such factors as climate, natural resources, and economic conditions. Thus, technology use varies from region to region and over time. 		
<u>Content Limits/Assessment Boundaries</u>		<u>Sample Stem</u>
<ul style="list-style-type: none"> Tasks should provide students with all needed evidence. 		

Grades 6-8 SCIENCE

Possible Evidence

- Students organize given data that represent the type of natural hazard event and features associated with that type of event, including the location, magnitude, frequency, and any associated precursor event or geologic forces.
- Students organize data in a way that facilitates analysis and interpretation.
- Students describe what each dataset represents.
- Students analyze data to identify and describe patterns in the datasets, including the
 - the location of natural hazard events relative to geographic and/or geologic features.
 - frequency of natural hazard events.
 - severity of natural hazard events.
 - types of damage caused by natural hazard events.
 - location or timing of features and phenomena (e.g., aftershocks, flash floods) associated with natural hazard events.
- Students describe similarities and differences between identified patterns.
- Students use the analyzed data to describe
 - areas that are susceptible to the natural hazard events, including areas designated as at the greatest and least risk for severe events.
 - how frequently areas, including areas experiencing the highest and lowest frequency of events are at risk.
 - what type of damage each area is at risk for during a given natural hazard event.
 - what features, if any, occur before a given natural hazard event and can be used to predict the occurrence of the natural hazard event and when and where they can be observed.
- Using patterns in the data, students make a forecast for the potential of a natural hazard event to affect an area in the future, including information on frequency and/or probability of event occurrence; how severe the event is likely to be; where the event is most likely to cause the most damage; and what events, if any, are likely to precede the event.
- Students give at least three examples of the technologies that engineers have developed to mitigate the effects of natural hazards (e.g., the design of buildings and bridges to resist earthquakes, warning sirens for tsunamis, storm shelters for tornadoes, levees along rivers to prevent flooding).

Grades 6-8 SCIENCE

Engineering, Technology, and Application of Science		6-8.ETS1.B.1
Core Idea	Engineering Design	
Component	Developing Possible Solutions	
MLS	Evaluate competing design solutions using a systematic process to determine how well they meet the criteria and constraints of the problem.	
<u>Expectation Unwrapped</u> <p>SCIENCE AND ENGINEERING PRACTICES</p> <p>Engaging in Argument from Evidence</p> <ul style="list-style-type: none"> Evaluate competing design solutions based on jointly developed and agreed-upon design criteria. Evaluate design solutions using a systematic process to compare their abilities to meet the needs and address the limitations posed by a problem. <p>DISCIPLINARY CORE IDEAS</p> <p>Developing Possible Solutions</p> <ul style="list-style-type: none"> There are systematic processes for evaluating solutions with respect to how well they meet the criteria and constraints of a problem. 		<u>DOK Ceiling</u> 3 <u>Item Format</u> Selected Response Constructed Response Technology Enhanced
<u>Content Limits/Assessment Boundaries</u> <ul style="list-style-type: none"> Tasks should focus design constraints on time, materials, cost, and safety. Tasks should provide all needed formulas. 		<u>Sample Stems</u> Wind turbines are a source of energy. There are three different designs of wind turbines explained below.
<u>Possible Evidence</u> <ul style="list-style-type: none"> Students identify the given supported design solution. Students identify scientific knowledge related to the problem and each proposed solution. Students identify how each solution would solve the problem. Students identify and describe additional evidence necessary for their evaluation, including: <ul style="list-style-type: none"> knowledge of how similar problems have been solved in the past. evidence of possible societal and environmental impacts of each proposed solution. 		Horizontal Axis Turbines Horizontal-axis wind turbines are what many people picture when thinking of wind turbines. Most commonly, they have three blades and operate "upwind," with the turbine pivoting at the top of the tower so the blades face into the wind.

Grades 6-8 SCIENCE

- Students collaboratively define and describe criteria and constraints for the evaluation of the design solution.
- Students use a systematic method (e.g., a decision matrix) to identify the strengths and weaknesses of each solution. In their evaluation, students
 - evaluate each solution against each criterion and constraint.
 - compare solutions based on the results of their performance against the defined criteria and constraints.
- Students use the evidence and reasoning to make a claim about the relative effectiveness of each proposed solution based on the strengths and weaknesses of each, given a situation related to human impact on the environment, students use scientific information and principles to identify the problem that
 - addresses the results of the particular human activity.
 - incorporates technologies that can be used to monitor and minimize negative effects that human activities have on the environment.
- Students identify relationships between human activity and the negative environmental impact based on scientific principles and distinguish between causal and correlational relationships to facilitate the design of the solution.
- Students collaboratively define and describe criteria and constraints for the evaluation of the design solution.

Vertical Axis Turbines

Vertical-axis wind turbines come in several varieties, including the eggbeater-style Darrieus model, named after its French inventor. These turbines are omnidirectional, meaning they don't need to be adjusted to point into the wind to operate.

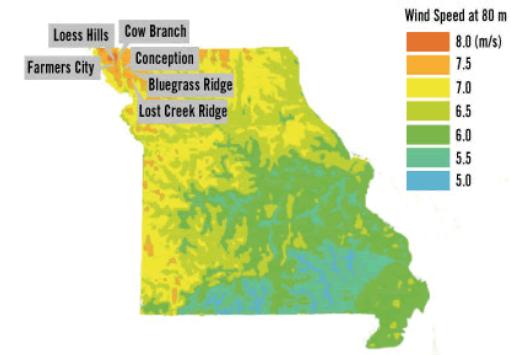

Utility-Scale Wind Turbines

Stimulus Materials

Graphic organizers, diagrams, graphs, data tables, drawings

Utility-scale wind turbines range in size from 100 kilowatts to as large as several megawatts. Larger wind turbines are more cost effective and are grouped together into wind plants, which provide bulk power to the electrical grid.

Wind Speed and Wind Farm Locations

1. a. Identify which type of wind turbine would be best for south central Missouri.
b. Use evidence to support your answer to part A.

	SCIENCE AND ENGINEERING PRACTICES	
	Analyzing and Interpreting Data	
	<ul style="list-style-type: none"> Analyze data from tests to compare and contrast design solutions for the purposes of combining the best components in a new solution to better meet the needs of the problem. 	
	DISCIPLINARY CORE IDEAS	
	Developing Possible Solutions	
	<ul style="list-style-type: none"> There are systematic processes for evaluating solutions with respect to how well they meet the criteria and constraints of a problem. Sometimes parts of different solutions can be combined to create a solution that is better than any of its predecessors. 	
	Optimizing the Design Solutions	
	<ul style="list-style-type: none"> Although one design may not perform the best across all tests, identifying the characteristics of the design that performed the best in each test can provide useful information for the redesign process—that is, some of those characteristics may be incorporated into the new design. 	
	<u>Content Limits/Assessment Boundaries</u>	<u>Sample Stems</u>
	<ul style="list-style-type: none"> Tasks should focus design constraints on time, materials, cost, and safety. Tasks should provide all needed formulas. 	Industrial scrubbers are devices that can control pollution by purifying the exhaust streams, which means that a minimal amount of harmful gases or particulates will leave the building and enter the environment. Below is a table comparing two types of scrubbers.

Grades 6-8 SCIENCE

Possible Evidence

- Students organize given data (e.g., tables, charts, graphs) from tests intended to determine the effectiveness of three or more alternative solutions to a problem.
- Students use appropriate analysis techniques (e.g., qualitative or quantitative analysis, basic statistical techniques of data and error analysis) to analyze the data and identify relationships within the datasets, including relationships between the design solutions and the given criteria and constraints.
- Students use the analyzed data to identify evidence of similarities and differences in features of the solutions.
- Based on the analyzed data, students make a claim for which characteristics of each design best meet the given criteria and constraints.
- Students use the analyzed data to identify the best features in each design that can be compiled into a new (improved) redesigned solution.
- Students identify relationships between human activity and negative environmental impact based on scientific principles and distinguish between causal and correlational relationships to facilitate the design of the solution.
- Given a situation related to human impact on the environment, students use scientific information and principles to identify the problem that
 - address the results of the particular human activity.
 - incorporate technologies that can be used to monitor and minimize negative effects that human activities have on the environment.

Type	Advantages	Disadvantages
Wet	<ul style="list-style-type: none"> - collect particles and acid gases - cools hot gases - minimal explosion or fire hazard 	<ul style="list-style-type: none"> - produces liquid waste - high potential for corrosion - increase moisture loading into flue gas - high energy cost for fine particles
Dry	<ul style="list-style-type: none"> - produces dry product (ease of handling) - high efficiency for extremely small particles 	<ul style="list-style-type: none"> - risk of damage at high temperature - risk of dew at low temperatures - potential risk of fire and explosion
<p>1. a. Identify the qualities that could be combined to produce the most effective and safe scrubber. b. Use evidence from the data to support your answer to Part A.</p>

Grades 6-8 SCIENCE

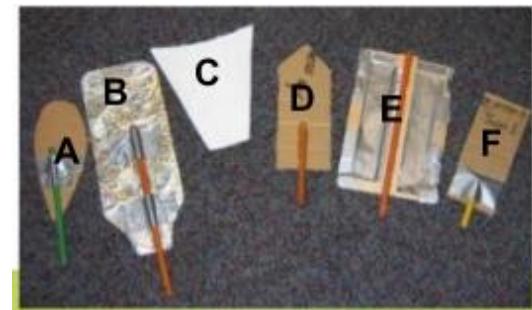

Engineering, Technology, and Application of Science		6-8.ETS1.B.3
Core Idea	Engineering Design	
Component	Developing Possible Solutions	
MLS	Develop a model to generate data for iterative testing and modification of a proposed object, tool, or process such that an optimal design can be achieved.	
<u>Expectation Unwrapped</u>		<u>DOK Ceiling</u> 3
SCIENCE AND ENGINEERING PRACTICES <p>Developing and Using Models</p> <ul style="list-style-type: none"> • Develop a model to generate data to test ideas about designed systems including those representing inputs and outputs. • Develop a model to generate data for repeated testing and modification of a proposed object, tool, or process for the purpose of the achievement of optimal design. 		Item Format Selected Response Constructed Response Technology Enhanced
DISCIPLINARY CORE IDEAS <p>Developing Possible Solutions</p> <ul style="list-style-type: none"> • A solution needs to be tested and then modified on the basis of the test results in order to improve it. • Models of all kinds are important for testing solutions. <p>Optimizing the Design Solution</p> <ul style="list-style-type: none"> • The iterative process of testing the most promising solutions and modifying what is proposed on the basis of the test results leads to greater refinement and ultimately to an optimal solution. 		
<u>Content Limits/Assessment Boundaries</u>		<u>Sample Stems</u>
<ul style="list-style-type: none"> • Tasks should focus design constraints on time, materials, cost, and safety. • Tasks should provide all needed formulas. 		<p>Students design and build a windmill from the ground up to obtain maximum electrical output. Stock gear boxes, generator kits, etc. are not allowed.</p> <ol style="list-style-type: none"> 1. Plan an investigation to determine which blade design is most effective to obtain maximum electrical output. Choose at least three designs from

Grades 6-8 SCIENCE

Possible Evidence

- Students develop a model in which they identify the components relevant to testing ideas about the designed system, including
 - the given problem being solved, including criteria and constraints.
 - the components of the given proposed solution (e.g., object, tools, or process), including inputs and outputs of the designed system.
- Students identify and describe the relationships between components, including the
 - relationships between each component of the proposed solution and the functionality of the solution.
 - relationship between the problem being solved and the proposed solution.
 - relationship between each of the components of the given proposed solution and the problem being solved.
 - relationship between the data generated by the model and the functioning of the proposed solution.
- Students use the model to generate data representing the functioning of the given proposed solution and each of its iterations as components of the model are modified.
- Students identify the limitations of the model with regard to representing the proposed solution.
- Students describe how the data generated by the model, along with criteria and constraints that the proposed solution must meet, can be used to optimize the design solution through iterative testing and modification.
- Given a situation related to human impact on the environment, students use scientific information and principles to identify the problem that
 - address the results of the particular human activity.
 - incorporate technologies that can be used to monitor and minimize negative effects that human activities have on the environment.
- Students identify relationships between the human activity and the negative environmental impact based on scientific principles and distinguish between causal and correlational relationships to facilitate the design of the solution.

the ones pictured and determine how many blades you will use.

2. What will you measure as the response?
3. How will the data be used to inform the design?
